Oracle PL/SQL Developer

Oracle PL/SQL | Production Systems | SQL Performance Tuning

Hyderabad | **Hybrid · onsite** | **4+ years**

Position Summary

We are looking for a hands-on Oracle PL/SQL Developer with 4+ years of experience delivering real-world solutions in live customer environments. This role requires someone who can explain production systems they have built or maintained and independently debug complex data and logic issues. Experience limited to internal, academic or proof-of-concept projects is not sufficient. Onsite presence is expected in Hyderabad as part of the hybrid work model.

Key Responsibilities

- Design, develop and maintain Oracle PL/SQL stored procedures, functions, packages, triggers and cursors for live production systems.
- Optimize and tune complex SQL queries for performance in high-volume Oracle database environments.
- Support and maintain data logic for real customer environments and production systems.
- Independently investigate, debug and resolve complex data and logic issues in production.
- Contribute to ETL processes, batch jobs or data migration projects as needed.
- Write or maintain Unix/Linux shell scripts for job scheduling and automation, where applicable.
- Engage in client-facing or enterprise support activities where required.

Mandatory Skills

- Strong hands-on experience in Oracle PL/SQL, including stored procedures, functions, packages, triggers and cursors.
- Query optimization and performance tuning for Oracle databases.
- Experience working with large-scale production data in real customer environments, not just POCs.
- Ability to independently debug and resolve complex data and logic issues.

Preferred / Good to Have

- Exposure to ETL processes, batch jobs or data migration projects.
- Familiarity with Unix/Linux shell scripting for job scheduling.
- Experience in a client-facing or enterprise support environment.
